

LAN Domain IT Audit Checklist

1. Firewall Configuration

- ☐ Ensure firewalls are set up correctly to block unauthorized traffic coming in/out.
- ☐ Check necessary ports and services are open and everything else should be closed off.
- ☐ Review firewall rules and access control lists to make sure they follow the company's security policies.

2. Router and Gateway Security

- ☐ Verify that router settings are secured with strong, unique passwords.
- ☐ Confirm that default settings and login credentials have been changed.
- ☐ Remote management is disabled or limited to secure channels

3. Intrusion Detection and Prevention

- ☐ Confirm that there's an IPS in place at the point where the company network connects to the internet.
- ☐ Ensure alerts are set up to catch and report any unusual activity or threats.
- ☐ Check that logs from these systems are reviewed regularly for signs of attacks.

4. Network Traffic Monitoring

- ☐ All data moving between the LAN and the internet should be tracked and logged.
- ☐ Logs should be stored securely and kept for a reasonable period.
- ☐ Use traffic analysis tools to watch for anything out of the ordinary.

5. Remote Access and VPN

- ☐ Ensure employees use a VPN when accessing the network from outside the office.
- ☐ VPN connections should be encrypted with strong protocols like TLS.
- ☐ Require multi-factor authentication (MFA) for all remote users.

LAN Domain IT Audit Checklist

6. Data Transmission Security

- ☐ All sensitive data should be encrypted when it leaves the company network.
- ☐ Make sure secure protocols like HTTPS are used

7. Updates and Patch Management

- ☐ Check firewalls, routers, and any IDS/IPS systems are updated regularly.
- ☐ Make sure all equipment is running the latest firmware and software

8. Compliance

- ☐ Make sure data is encrypted and that only authorized users have access.
- ☐ Check that audit logs are in place for systems handling payment or client financial information.

9. Incident Response

- ☐ LAN-to-WAN controls support PCI DSS requirements for securing financial data in transit.
- ☐ Firewalls and routers are configured to isolate traffic in the event of an attack.
- ☐ IT staff is trained to handle data leakage or attacks from the WAN.
